INNOVATIVE METHODS OF LEARNING FOREIGN LANGUAGES

It is well known that in our time of global communications, the culture of communication is an important means of realizing the individual in society. In the process of socialization, languages play an important role. They help us to communicate with people, to solve important issues that concern not only relations between different countries but also some private issues. Therefore the study of foreign language has become very important and is considered as branch of significant knowledge, because it opens to man new styles of life, gives the person cross cultural education. So, it provides the chance to discover in detail the various cultures of the world. All these factors are important for creating a single cultural space in a global society.

In Ukraine, foreign studies are becoming increasingly important. In order to establish relations with other countries, Ukraine needs highly educated people who are fluent in foreign languages or at least one language in perfect. It is very important for our country in order to achieve a higher level of representation of their country in the international arena, to overcome cultural, socio-political barriers.

In our opinion, Ukraine should not only increase its level in foreign policy, but also put into practice innovate education at the national level in the domestic policy, in order to ensure in-depth study of foreign languages.

We believe that for this purpose it is necessary to develop more efficient and effective, state-of-the-art facilities that will motivate students to study foreign languages not only of ordinary citizens, but also of civil servants of different levels who work in state bodies and institutions of Ukraine. This is extremely important; civil servants must represent the state; they are the face of both the domestic and foreign policy of the state, which creates county's image as a European state.

Having analyzed the situation, in our opinion, it is possible to propose some effective, innovative methods for learning foreign languages, which will help in learning languages.

One of these methods is a work on a project, and this type of work provides a special orientation of learning on cognitive self-study activities. It is the self-organization of the individual that is the main factor in mastering any knowledge. Projects can be divided into mono-projects, collective projects (for example, teamwork), oral-, written-, and Internet-projects.

The self-organization of the project process aims the person at a multi-level approach to language learning that can cover reading, listening, speaking and grammar. When working on a project independently and even in a group, the person certainly develops critical thinking as active independent thinking. An addition to this is the fact that projects help differentiate between individual-creative and active-action approaches to learning.

The second method, we believe, is multimedia complexes. This method is related to modern computer technologies, which make a large contribution to language learning. By helping a variety of interesting ideas, videos that motivate learning through curiosity, novelty, adaptability, these technologies encourage students, students, citizens, thereby enhancing activity. In the educational process, they increase the motivation of learning, stimulate creative activity and promote the development of personality, expanding the ability to provide educational information.

The third method is the method of game. It promotes more active, rapid learning. At the same time, by stimulating the participants with some prize for more effective work, the teacher reduces the psychological burden from the learning process; the teacher (or tutor) switches emotions from negative to positive. It, in our opinion, also increases brain activity and gives the process of learning new knowledge a certain ease.

Scientists say that the game is the most accessible type of activity, it is useful way of processing the impressions received from the outside world. While playing we can clearly demonstrate the features of thinking and imagination, emotionality, activity, a developing need for communication.

We can list a few of these games, such as Chain-story. This game is somewhat similar to our Spoiled- Phone game. The purpose of it is to continue the story of the previous student while using one sentence.

Grab - minute game is also can be taken in practice. The goal of this game is to explain a word that is written on a piece of paper for one minute. When explaining the words, participants refresh their vocabulary with new words, activate their speaking skills, and learn how to respond to unexpected situations.

Having analyzed the various innovative methods, we can conclude that there are a large number of advanced methods. When making language learning more diverse, engaging, and being involved with the activity of learners, we thus capture the individual in the process, helping not only to learn but also to develop a great many qualities, such as critical thinking, ability of team working, capacity of independent self- education.
